

### Features

Suitable for rotating and oscillating movement, less maintenance requirements due to the long re-lubrication intervals, lower wear, lower susceptibility to edge loading, no absorption of water and therefore no swelling, good damping behaviours, good resistance to shock loads.

### Structure

**1. POM thickness 0.30~0.50 mm**, it provides high wear resistance and low friction even with only minute volume of lubricant are supplied, this bearing surface carries a pattern of circular indents which should be filled with grease on assembly of the bearing.

**2. Sintered bronze powder thickness 0.20-0.35mm**, provides max. thermal conductivity away from the bearing surface, also serves as a reservoir for the resin mixture.

**3. Low-carbon steel**, provides exceptionally high load carrying capacity, excellent heat dissipation.

**4. Copper/Tin plating thickness 0.002mm**, provides good corrosion resistance.

### Tech. Data

|  |                      |                                      |                      |            |                        |              |       |
|--|----------------------|--------------------------------------|----------------------|------------|------------------------|--------------|-------|
| Max. load  | Static               | 250N/mm <sup>2</sup>                 | Temp. limit          |            |                        | -40°C~+110°C |       |
|  | Very low speed       | 140N/mm <sup>2</sup>                 |                      | Max. speed | Pre-lubricated         |              | 2m/s  |
|  | Rotating oscillating | 70N/mm <sup>2</sup>                  |                      |            | Oiling Grease          | Continuous   | >2m/s |
| Max. PV  |                      | 3N/mm <sup>2</sup> *m/s              | Thermal conductivity |            | 50W(m*K) <sup>-1</sup> |              |       |
| Coefficient of thermal expansion                             |                      | 11*10 <sup>-6</sup> *K <sup>-1</sup> | Friction coefficient |            | 0.05~0.20              |              |       |
| Initial pre-lubrication at assembly is strongly recommended. |                      |                                      |                      |            |                        |              |       |

### Typical Applications

Recommended for applications involving intermittent operation or boundary lubrication...

**Automotive:** suspension joints, kingpin assemblies and stub axles of trucks, automobile driving joint hinges, steering and other linkages, articulation joints, rear chassis hinges, fair leader rollers...

**Machine tool building industry:** spindles in drill, grinding, and milling machines, ram guide plates in multi-ram

presses...

**Agricultural equipment:** gearbox, clutch, bale trips and wheel caster swivels for bale accumulators, front axle pivot bearings, steering idler box bearings and kingpin bearings for harvesters...

It is especially well-suited for applications where lubricant can not be supplied continuously or repeatedly.
